# **SYSTEM STUDY**

Date: 19/09/2023

Guide: Ms. Nimmy Francis

## **Project Overview:**

The Project entitled “Online Crime Reporting System” aims to enhance the efficiency and transparency of crime reporting and investigation processes. It facilitates the entire crime management lifecycle, from reporting incidents to case resolution, providing a seamless experience for law enforcement, administrators, and the public.

## **To What Extent the System is Proposed For:**

The proposed system is primarily designed for law enforcement agencies, officers, and the general public. It empowers citizens to report crimes, assists law enforcement in managing cases, and provides administrators with tools to oversee the system effectively.

## **Specify the Viewers/Public Involved in the System:**

The viewers/public involved in the system include administrators, law enforcement officers, and the general public (citizens).

## **List of Modules Included in the System:**

- a) Administrator Module
- b) Law Enforcement Officer Module
- c) Citizen Module

## **Identify the Users in Your Project:**

Admin

Law Enforcement Officers

Citizens

## **Who Owns the System?:**

The system is typically owned and operated by law enforcement agencies or government bodies responsible for public safety.

**System is Related to Which Firm/Industry/Organization?:**

The system is related to the law enforcement and public safety industry, serving as a platform for reporting and managing criminal incidents.

**Details of Person or Resources Contacted for Data Collection:**

Law enforcement databases and records

Crime reports and statistics

Legal authorities and experts

Public safety organizations

**Questionnaire to Collect Details About the Project:**

Q: What challenges are you currently facing in managing criminal incidents that this system aims to address?

A: Our current crime management processes lack efficiency and transparency. We struggle with the timely reporting of incidents, coordination among law enforcement agencies, and maintaining a comprehensive database of criminal activities.

Q: How is user authentication and authorization currently managed within your law enforcement operations?

A: User authentication primarily relies on secure access credentials. We must ensure secure user authentication by utilizing robust authentication systems and following security best practices to protect sensitive data.

Q: Could you describe the types of crimes and incidents you handle, and how are they currently managed?

A: We handle a wide range of criminal activities. Currently, these incidents are managed through manual reporting, paper documentation, and legacy systems. There is a need for a centralized system to streamline incident reporting, investigation, and case management.

Q: How do you currently monitor the performance of your law enforcement operations, including case resolution and public satisfaction?

A: Performance monitoring is currently decentralized, making it challenging to assess the overall effectiveness of our operations. We lack a centralized dashboard for real-time insights. The system aims to implement performance tracking and feedback mechanisms to enhance operations.

Q: Are there any machine learning or analytics features you envision for this crime reporting system?

A: While not a primary focus, we see potential for machine learning modules to enhance crime pattern recognition, suspect identification, and predictive policing. These capabilities could improve the efficiency of our crime management processes.

Q: What is the expected timeline for implementing the crime reporting system?

A: We anticipate that the implementation of the system will take around 12-18 months, considering the complexity of integrating with existing systems and ensuring data security.

Q: What budget considerations are there for this project?

A: We have allocated a budget that includes software development costs, hardware infrastructure, security measures, training, and ongoing operational expenses.

Q: Do you have any specific security and privacy requirements for sensitive crime data, ensuring compliance with data protection regulations?

A: Yes, we have stringent security and privacy requirements to protect sensitive crime data, including encryption, access controls, and compliance with relevant data protection regulations.

Q: Are there any existing software or systems that need to be integrated with this crime reporting system?

A: Yes, we have existing systems for criminal records, evidence management, and incident reporting that need to be integrated with the new crime reporting system for seamless data exchange and efficiency.

# Feasibility Study

A feasibility study is like the foundation of a big project, and it's crucial for any project, including this one. It's a careful and organized look at the project to see if it's a good idea and if it can work.

There are three main parts to this study:

1. Technical Feasibility
2. Economic Feasibility
3. Operational Feasibility

**Technical Feasibility** plays a pivotal role in ensuring the system's capability to meet the technical challenges and requirements. This includes an evaluation of the existing technology infrastructure to determine if it can adequately support the system's demands, encompassing considerations such as server capacity and network resources. Compatibility across different web browsers, devices, and operating systems is crucial to ensure that both users and administrators can access the system seamlessly. Scalability is another essential factor, as the system must be able to handle a potentially large volume of crime reports, user registrations, and data storage. Additionally, robust data security and privacy measures must be implemented to safeguard sensitive crime data and user information, including encryption, access controls, and compliance with data protection regulations.

**Economic Feasibility** assesses the financial aspects associated with the development and maintenance of the system. Initial development costs, including software development, hardware procurement, and any necessary third-party software or tools, must be carefully considered. Furthermore, ongoing operational expenses such as system maintenance, technical support, and server hosting fees must be factored in. Calculating the potential return on investment (ROI) is vital, as it helps estimate the benefits derived from the system, such as reduced administrative costs, improved crime reporting efficiency, and enhanced data analysis capabilities.

**Operational Feasibility** is essential to evaluate the practicality and usability of the system within the organization. This involves ensuring that the system aligns seamlessly with existing crime reporting workflows, minimizing disruptions and complexity. The user-friendliness of the system is another critical aspect, as the success of the project hinges on how effectively users, including law enforcement officers and citizens, can navigate and utilize it. Adequate resource availability, encompassing human capital, training, and support, is necessary for successful implementation and maintenance. Lastly, the system's long-term sustainability is a key consideration, ensuring its adaptability to changing organizational needs and technological advancements, thereby serving as a strategic asset for years to come.

In conclusion, the development of the Online Crime Reporting System has the potential to transform and optimize crime reporting and management processes, enhancing communication between law enforcement agencies and the public. However, the success of this project relies

heavily on a comprehensive feasibility study. By addressing technical, economic, and operational aspects, the study ensures that the system is not only technically capable and financially sustainable but also practical, user-friendly, and adaptable to the evolving needs of the organization and the community it serves.
